

MTV-S1183
Beam Time Report

Test of Time Reversal Symmetry Using Polarized Unstable Nuclei

Ryosuke Tanuma
for the MTV collaborators.

Department of Physics, Rikkyo University, Tokyo, Japan

Final Test Run for Physics production in 2014
Schedule: Beam Time 11/15-11/16

TRIUMF-ISAC Science Forum (20. Nov. 2013)

INDEX

INTRODUCTION

MTV : Mott Polarimetry for T-Violation experiment

β decay rate function

$$\omega(\langle \vec{J} \rangle, \vec{\sigma} | E_e, \Omega_e) dE_e d\Omega_e = \frac{F(\pm Z, E_e)}{(2\pi)^4} p_e E_e (E_0 - E_e)^2 dE_e d\Omega_e \times \xi \left(1 + b \frac{m}{E_e} + \frac{\vec{p}_e}{E_e} \left(A \frac{\langle \vec{J} \rangle}{J} + G \vec{\sigma} \right) + \vec{\sigma} \cdot \left(N \frac{\langle \vec{J} \rangle}{J} + Q \frac{\vec{p}_e}{E_e + m} \left[\frac{\langle \vec{J} \rangle \cdot \vec{p}_e}{J E_e} \right] + R \frac{\langle \vec{J} \rangle}{J} \times \frac{\vec{p}_e}{E_e} \right) \right)$$

OSAKA@ISAC-I

T transform

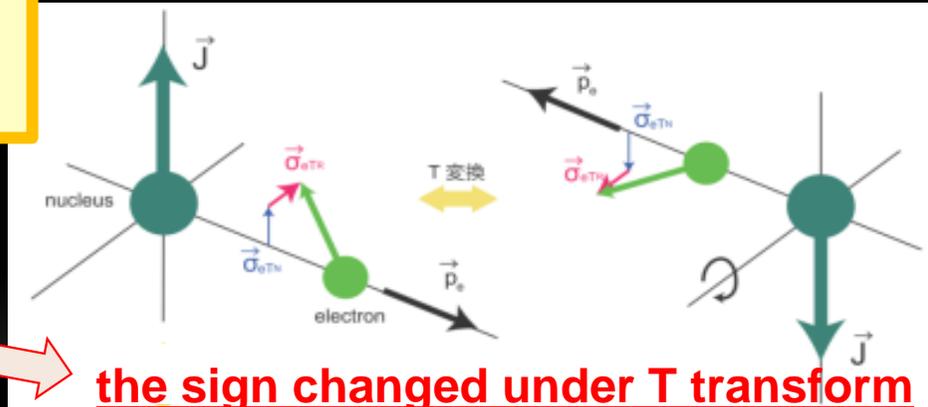

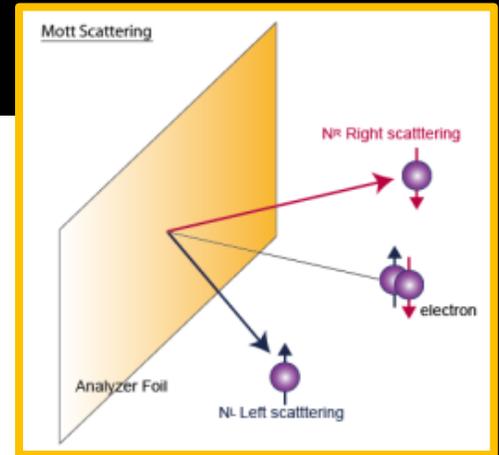

$$R \vec{\sigma} \cdot \frac{\langle \vec{J} \rangle}{J} \times \frac{\vec{p}_e}{E_e} \longleftrightarrow -R \vec{\sigma} \cdot \frac{\langle \vec{J} \rangle}{J} \times \frac{\vec{p}_e}{E_e}$$

- \vec{J} : Parent Nuclear Pol.
- $\vec{\sigma}$: Electron Pol.
- \vec{p}_e : Electron momentum

R=0 ? or R≠0 ?

R≠0 => T-Violation !

Backward Mott scattering

the sign changed under T transform

Left-Right Asymmetry

R correlation 3 components

1. Pol. Nuclei. produced @ISAC
2. Electron momentum

3. Electron Trans. pol.

Evidence for New Physics beyond the Standard Model

Previous MTV Experiment

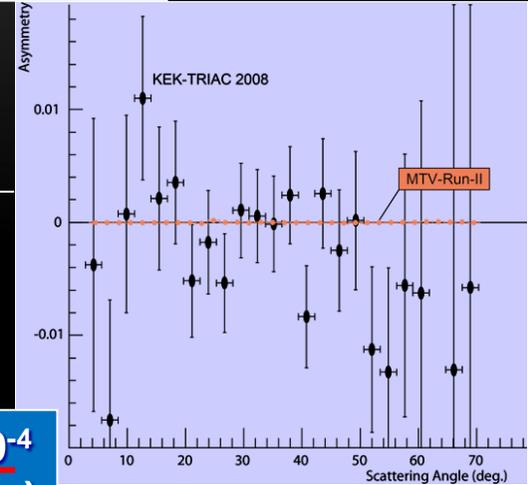

2008. 4 : Unpol. Test Exp.

2008. 9 : Physics Run : 10% precision

$$R = -0.020 \pm 0.41_{\text{sta}} \pm 0.024_{\text{sys}}$$

Main detector: **planer MWDC** **178keV/u @ 10⁵pps**
 @KEK-TRIAC JAPAN **8% polarization**

2009. 11 : Run-I Test Exp. : 1% precision

2010.11 : Run-II Physics Run : 0.1% precision Exp.

three orders of magnitude improvement !

Main detector: **planer MWDC** **28keV @ 10⁴-10⁷pps**
 @TRIUMF CANADA **80% polarization**

$$\text{Asym.} \sim (0.2 \pm 2.1) \times 10^{-4} \text{ (preliminary)}$$

high beam intensity & polarization required.

Main detector : planer MWDC

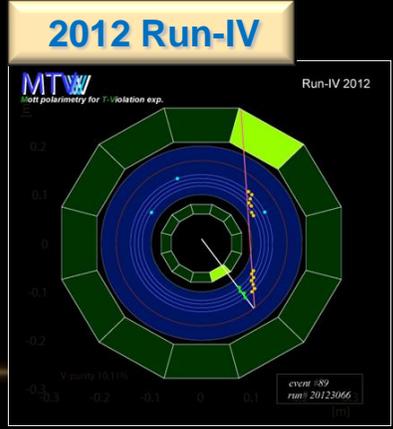

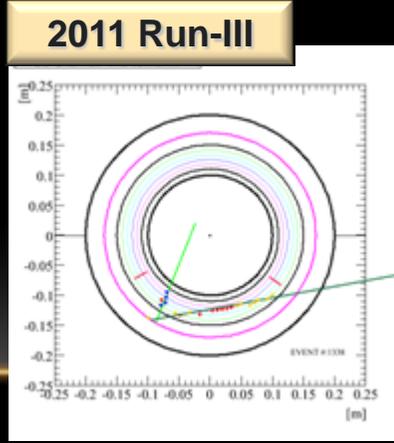

2011. 11 : Run-III Unpol. CDC Commissioning

Goal : checking V-track event using a part of CDC.

2012. 11 : Run-IV Trigger Detector & DAQ full setup Test

Goal : Installing trigger detector and DAQ for CDC & obtaining V-track rate using full setup.

2013. 11: Run-V Final Demonstration Exp.

Main detector : Cylindrical Drift Chamber

Schedule: 11/15-11/16 (original) → 11/16 – 11/17 (actual)

- Beam time actually started from 11/16(12:00) to 11/17(12:00). → 2 shifts.
- It's because tuning of ${}^7\text{Li}$ for MTV/ $\beta\text{NMR}/\beta\text{NQR}$ took long time due to Faraday Cup trouble.

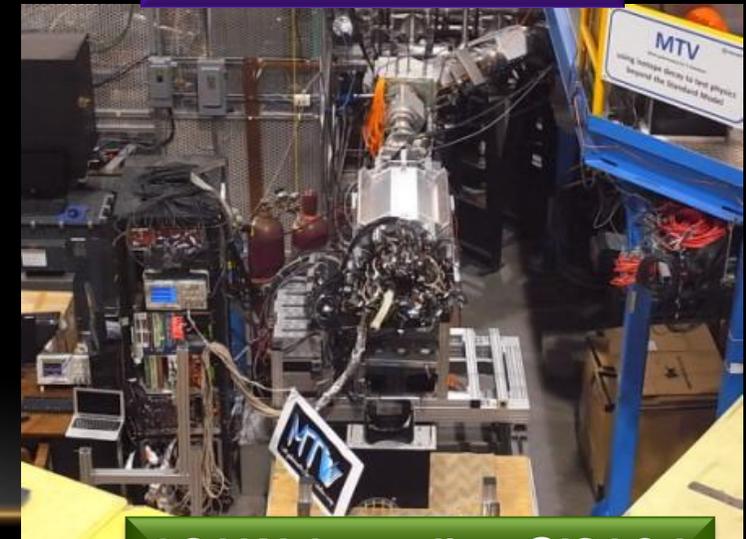

Motivation

- Studying systematic effect for Physics Run using CDC scheduled in 2014.

Beam Menu

- Rate Stability using beam 10^7pps
- Systematic Study
 - ✓ taking unpolarized beam data as UP-DOWN-UNPOL sequence
 - ✓ comparison high and low rate beam intensity.
- Relaxation time measurement
 - ✓ Beam Stopper Upgrade

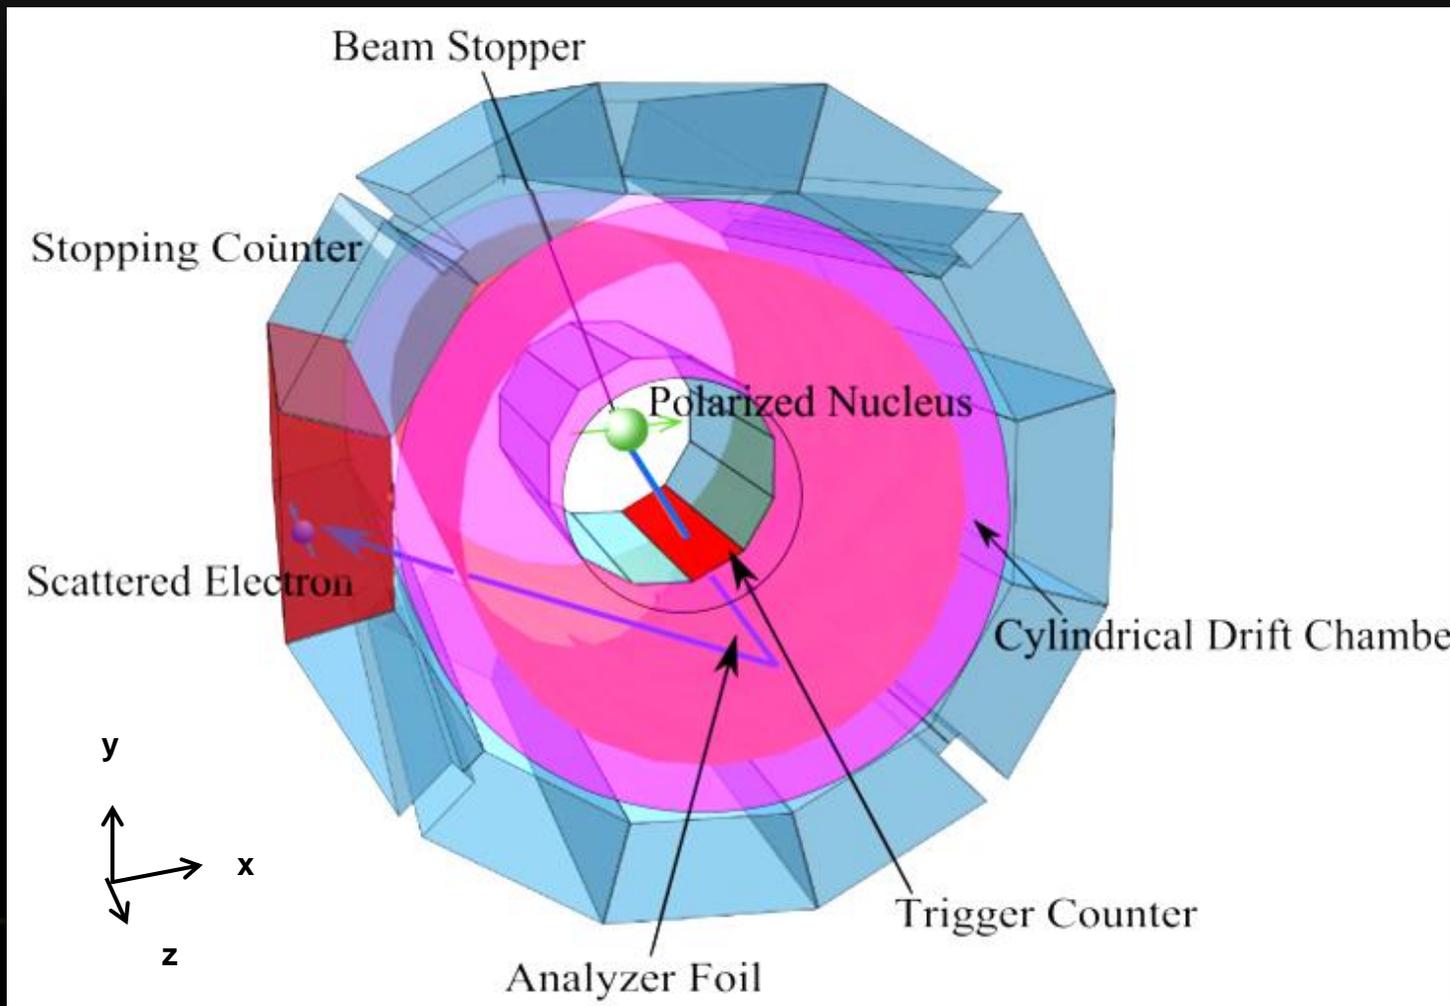

Beam : Pol./Unpol. ${}^8\text{Li}$
 Energy : 28keV
 Intensity : $10^4\text{pps} \sim 10^7\text{pps}$

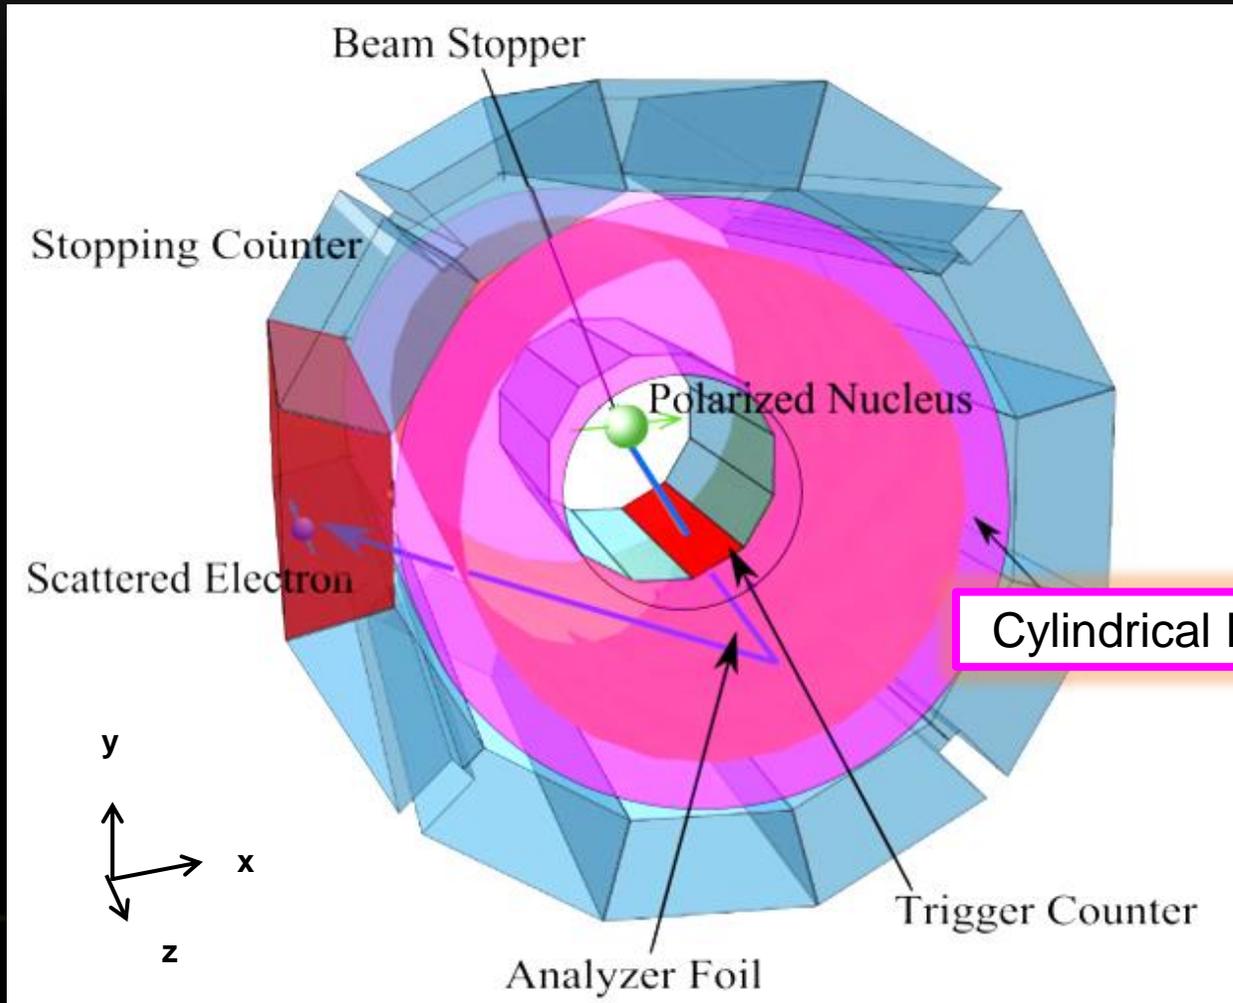

OSAKA beam line @ISAC-I

DETECTOR SETUP & DAQ

Detector Setup

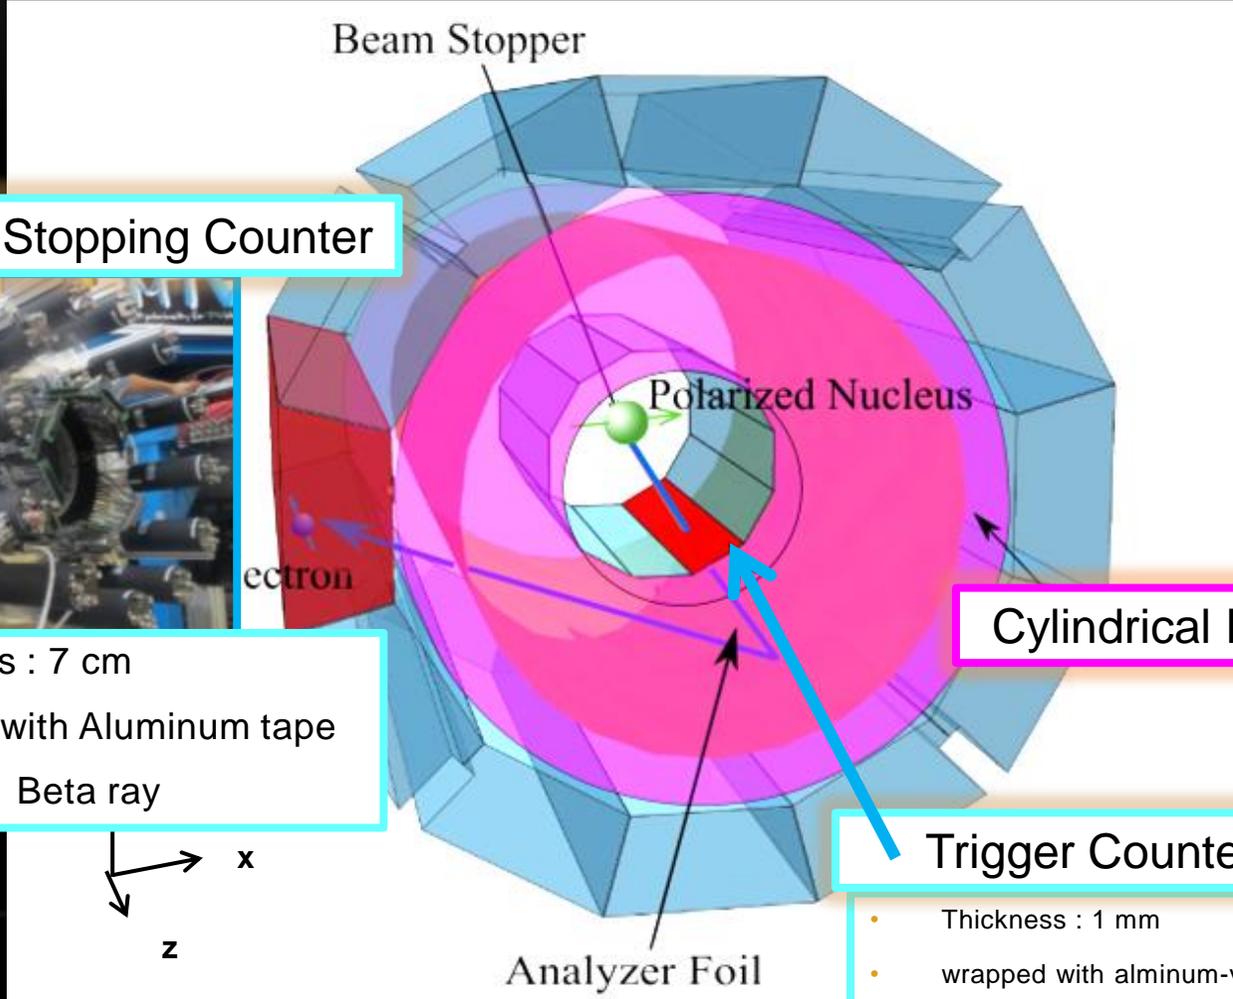

Detector Setup

- Readout : 400ch
- gap: 4 mm
- Ar:CF4=160:80

Cylindrical Drift Chamber

Detector Setup

- Thickness : 7 cm
- wrapped with Aluminum tape
- Stopping Beta ray

- Readout : 400ch
- gap: 4 mm
- Ar:CF4=160:80

- Thickness : 1 mm
- wrapped with alminum-vapored tape
- Triggering Event

New FPGA-based system is developed with General Purpose VME board.

2009 Run-I
2010 Run-II 2011 Run-III

2012 Run-IV
2013 Run-V

Trigger part

- ✓ Lv.1 trigger (Plastic Scintillation Counter) OR logic circuit of 12 Trigger Counters.
- ✓ Lv.2 trigger (CDC + Counters) Counter circuit for hit wires for setting lower limit to the count number of hit wires.

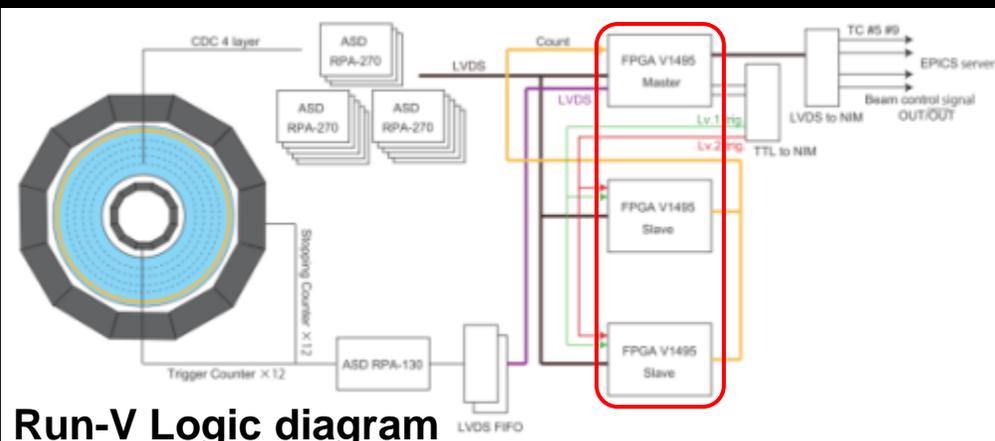

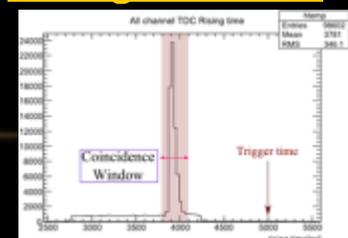

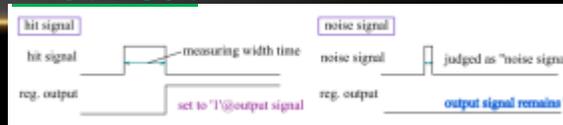

DAQ part

Coincidence Register

- ✓ Hit pattern is recorded. —> No TDC information
- ✓ Fixed data size in each event

Speeding Up ! **rising time cut**

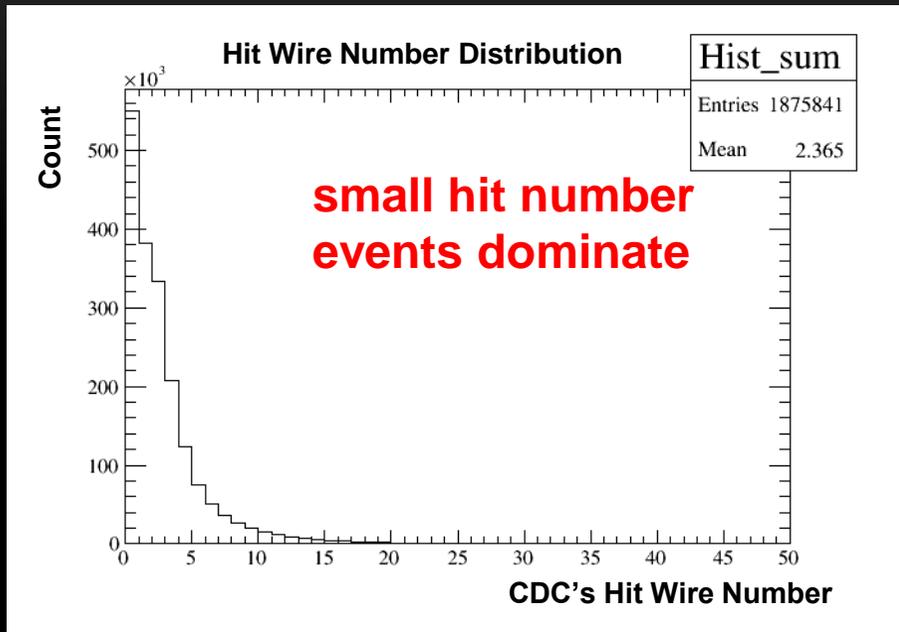

width cut

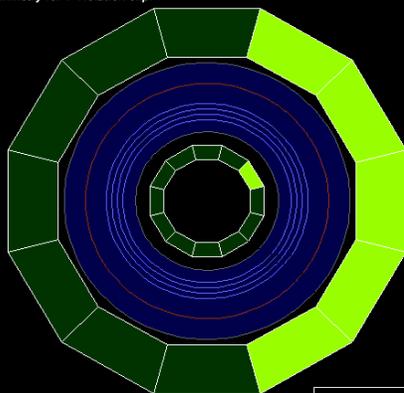

Master-Slave System using 3 FPGA Board

RESULTS

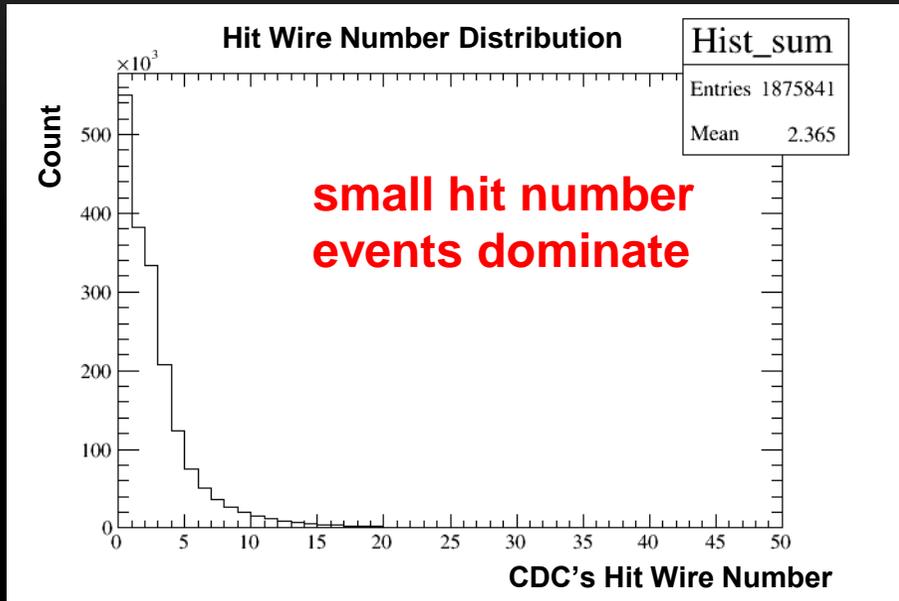

Lv.1 (Scintillation Counter)

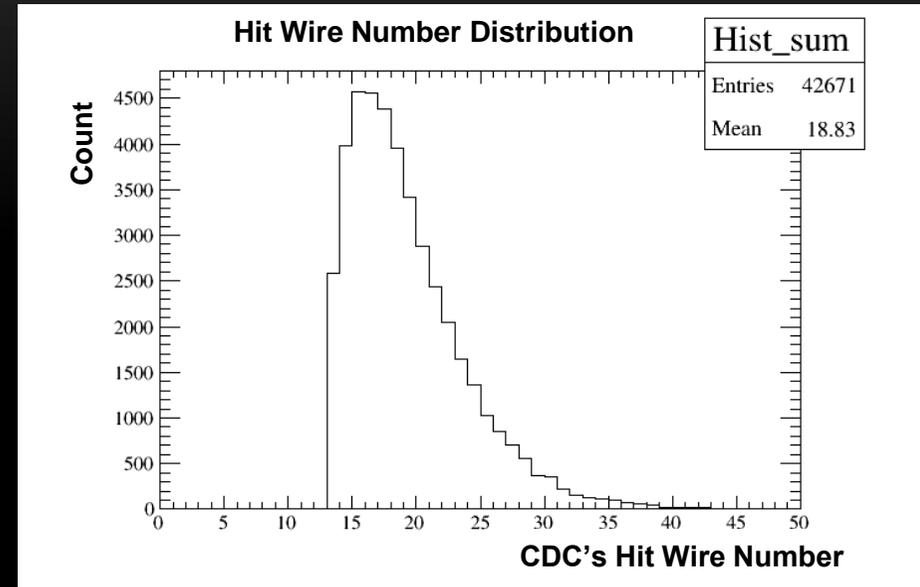

Lv.2 (Counter + CDC)

Lv.1 (Scintillation Counter)

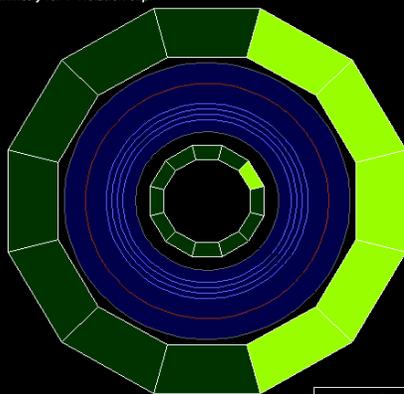

Lv.2 (Counter + CDC)

MTV
Mott polarimetry for T-Violation exp.

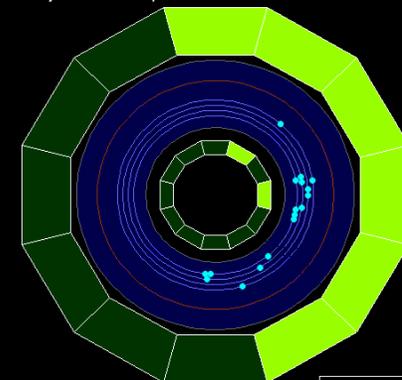

2013 MTV

event #:0
run #:20133154

MTV
Mott polarimetry for T-Violation exp.

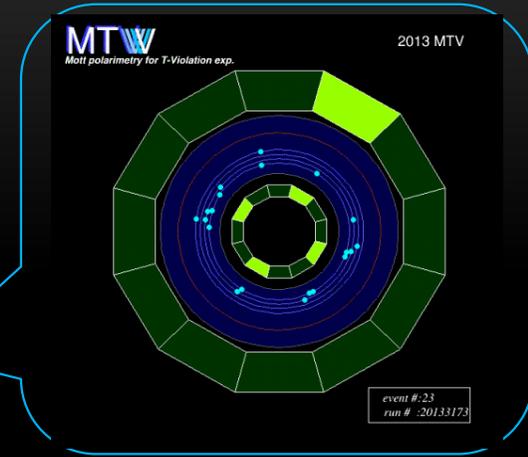

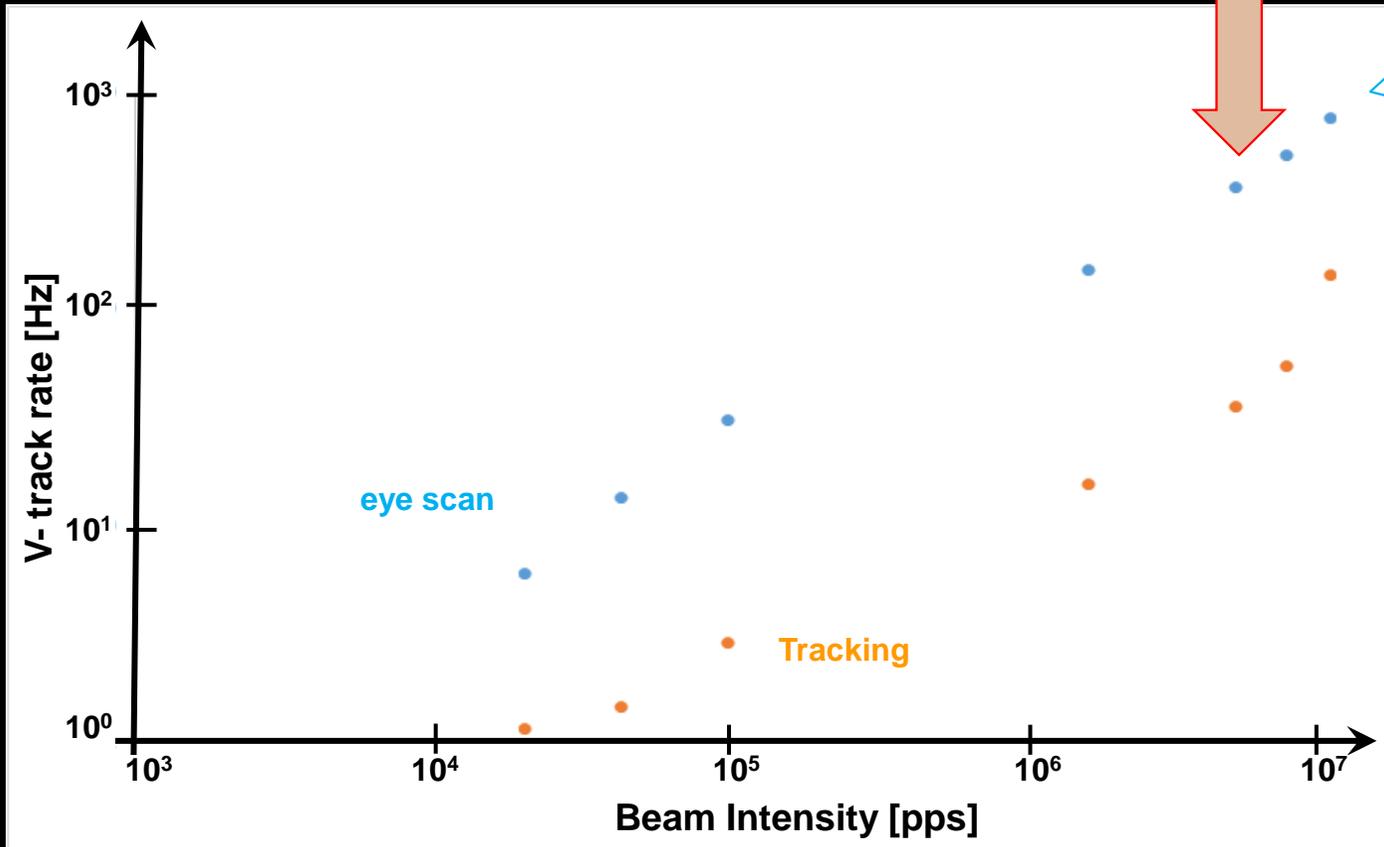

2013 MTV

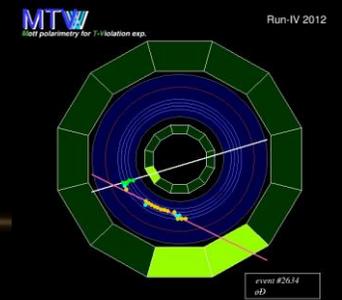

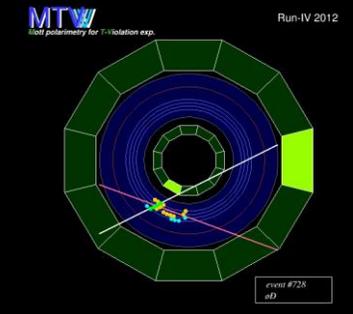

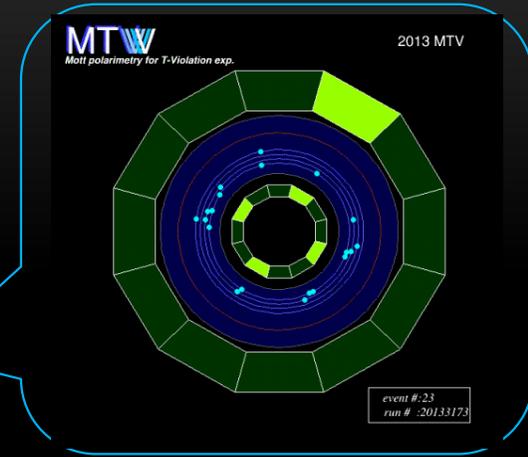

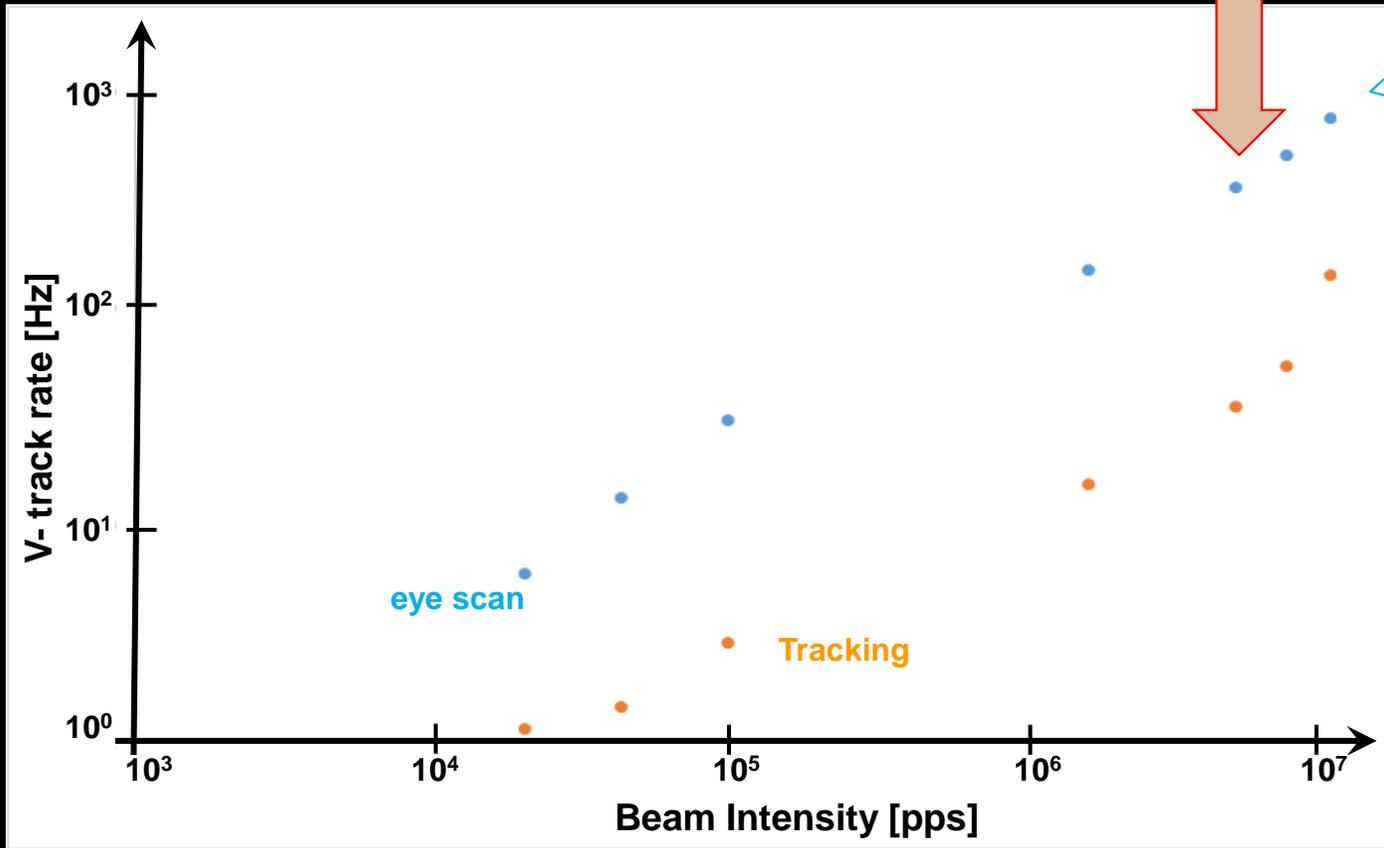

event #.:1
run #:20133156

Suppressed small hit number event.

Result —Rate Stability—

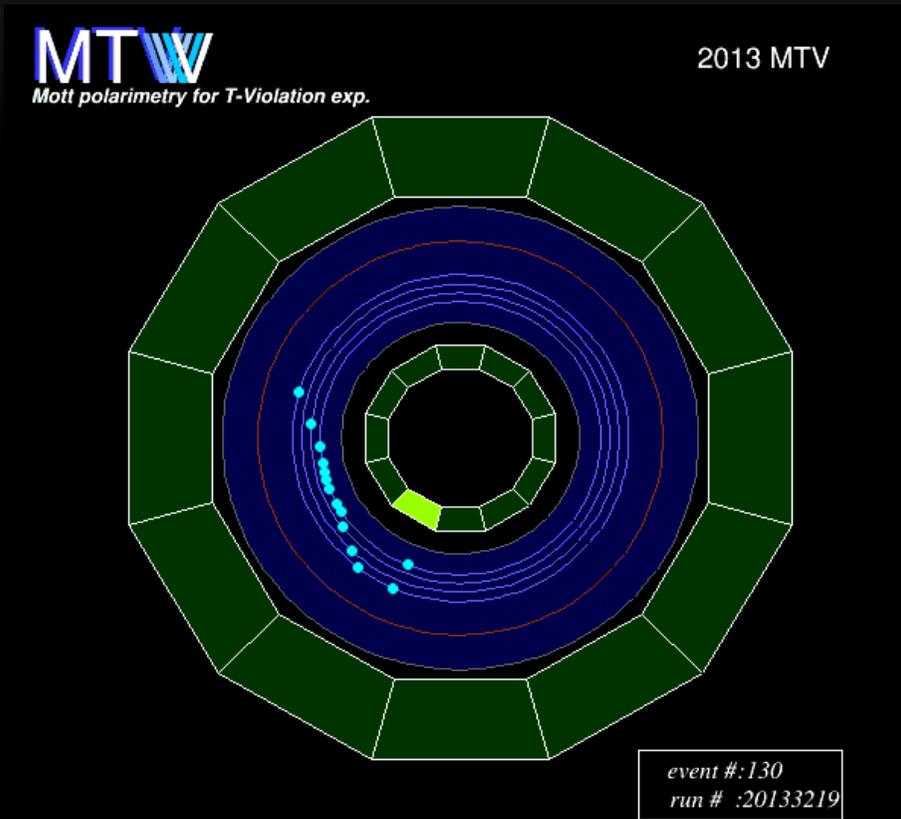

Result —Rate Stability—

1 shift was used for tuning setup.
Another 1 shift was used for Physics run

Event Display

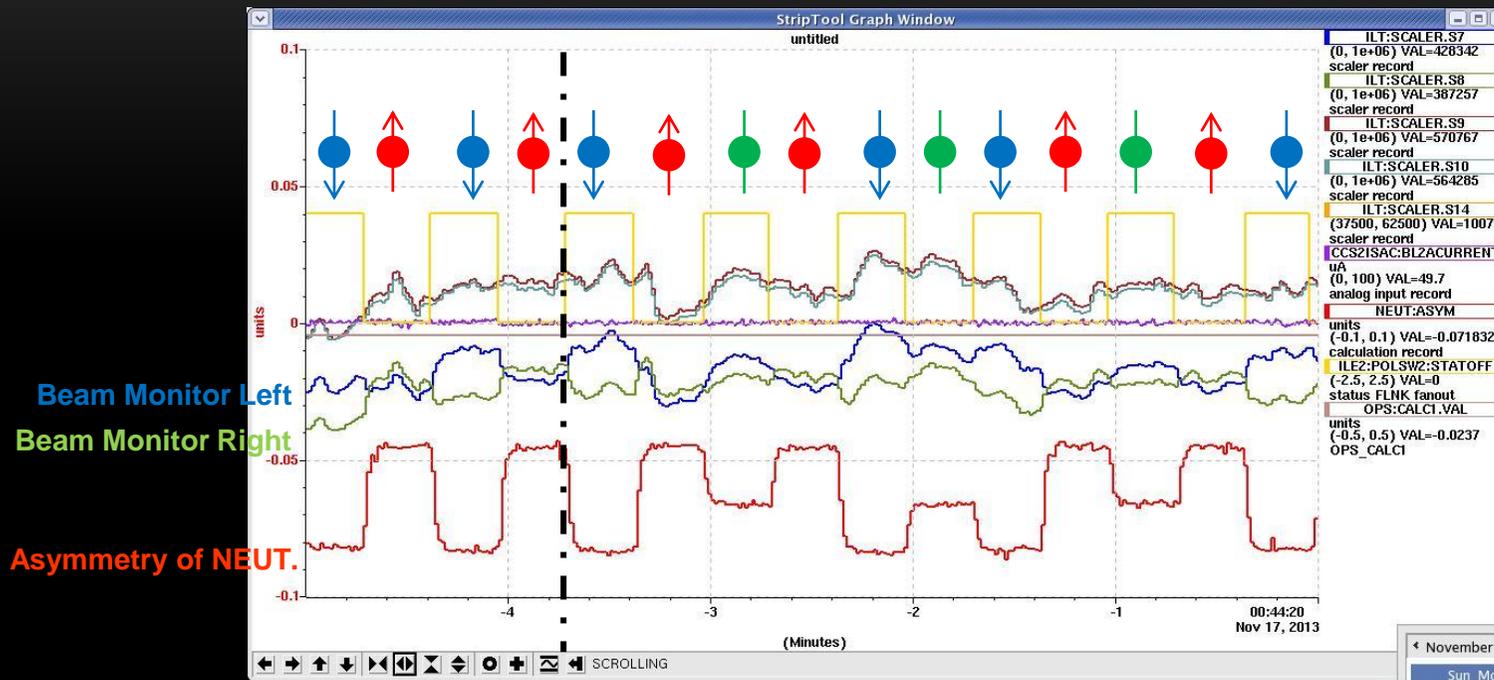

Run	Obtained event #
High intensity	70 M events
Low intensity	6.3 M events
Unpol. run	3.9 M events

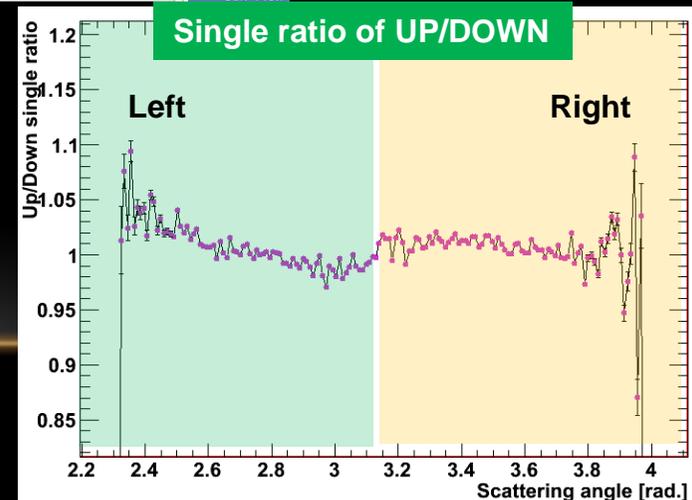

V-track event rate: Max. 100Hz (purity:16%)

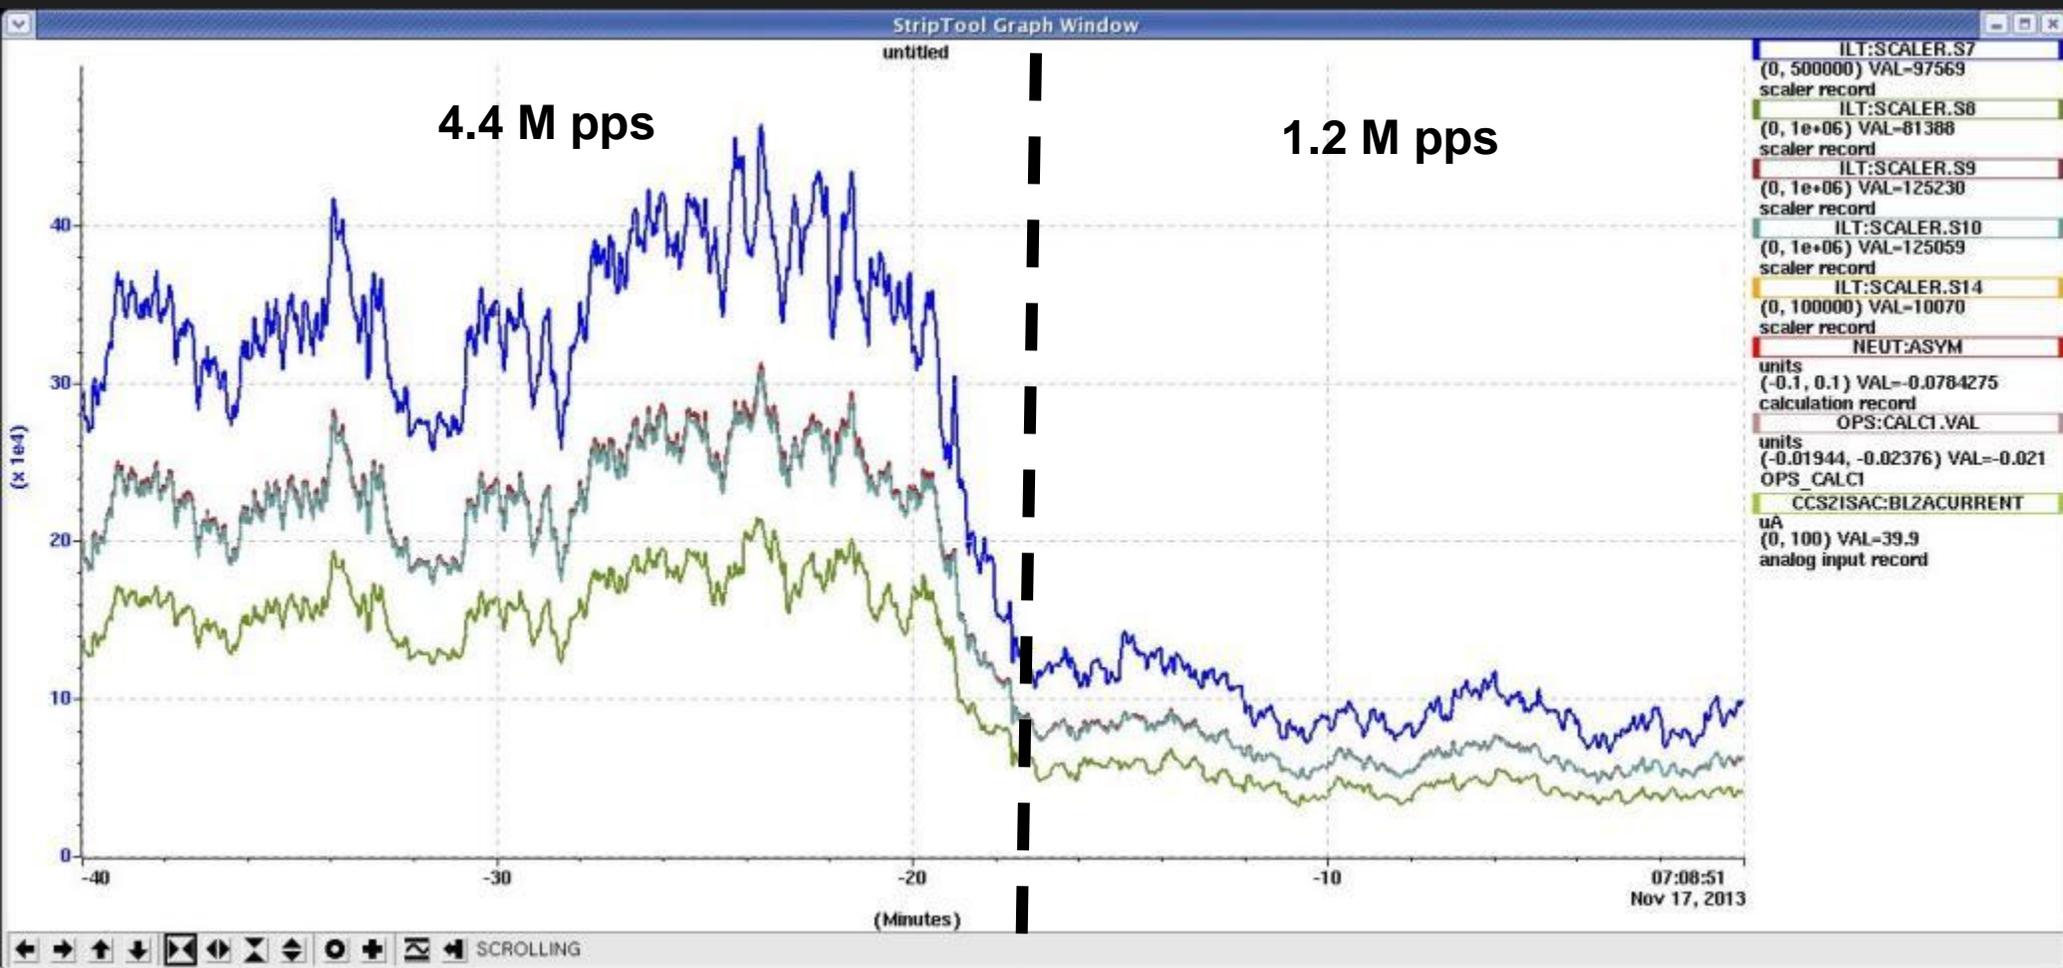

We achieved to collect enough number of events for systematic study.

UP-DOWN-UNPOL sequence

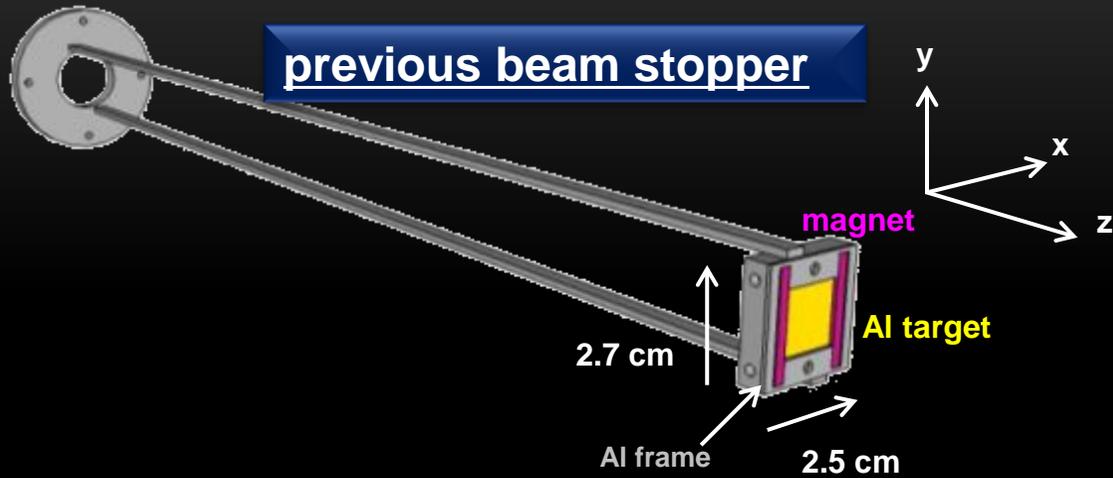

Unpol. data is required from Run-II analysis.
It's found that the left-right efficiency of the detector doesn't conserve during spin-flip and that we can correct the systematic effect using Unpol. data.

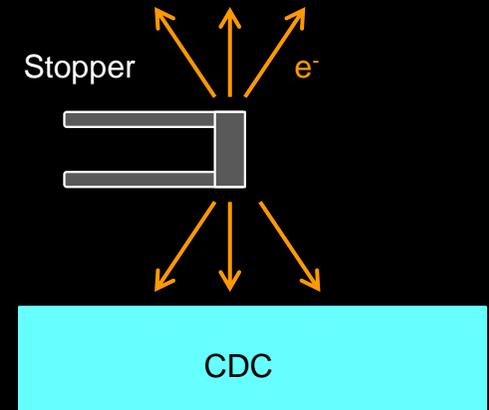

whether the fluctuation become systematic effect should be checked.

Beam Time Result —Relaxation time—

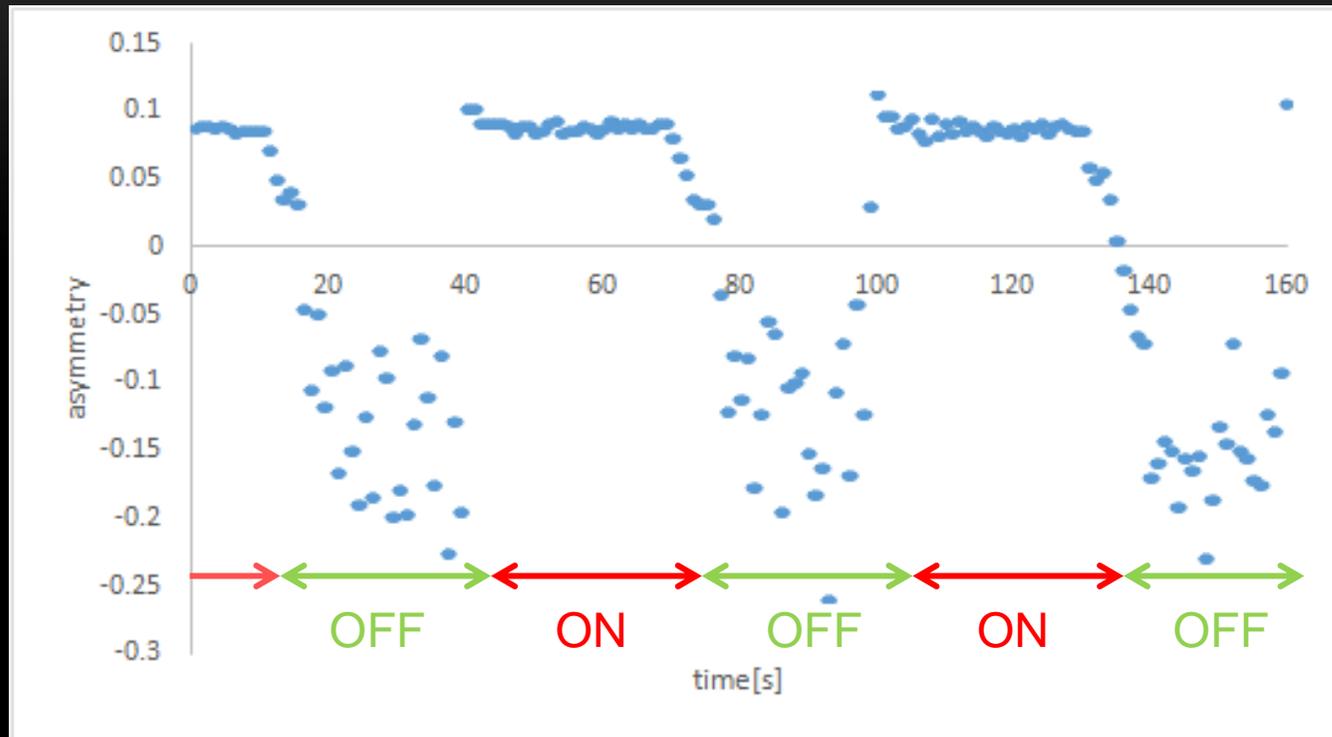

- ✓ previous beam stopper was designed for planer MWDC.
- ✓ There are Al frame and magnet at the emission angle of electron.

new beam stopper

Beam Time Result —Relaxation time—

previous beam stopper

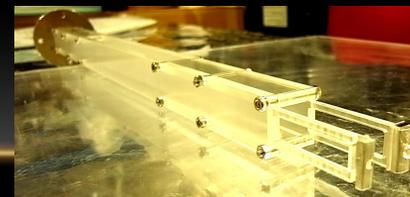

~ 2.0 sec.

improved

new beam stopper

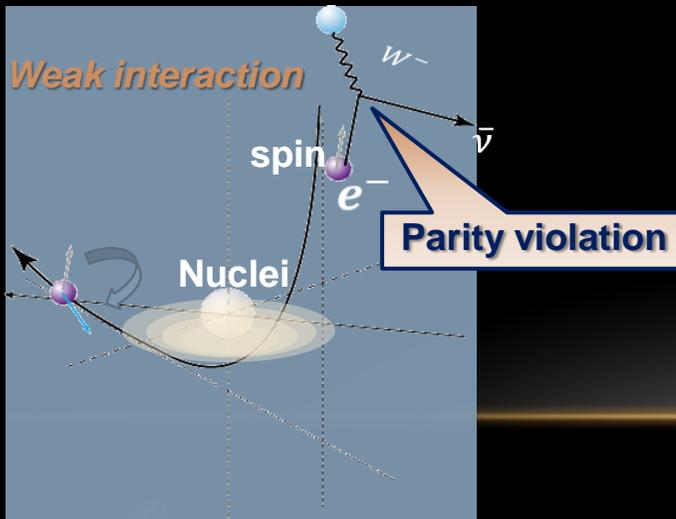

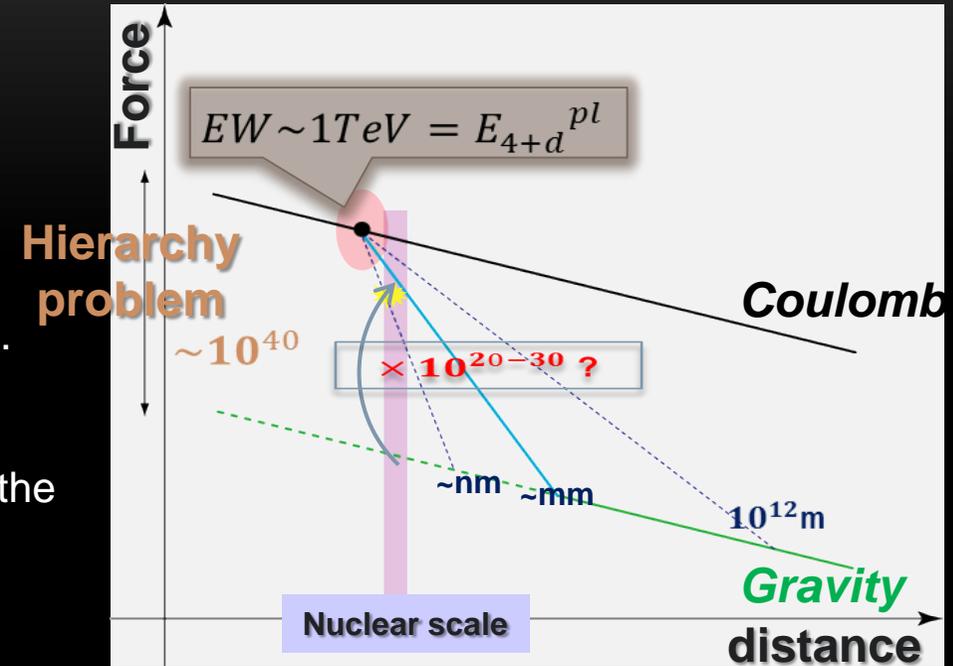

~ 4.0 sec.

MTV-G EXP.

MTV-G exp. is the test of Inverse square law by Newton at Nuclear scale and search for Large-extra dimension model (called ADD model).

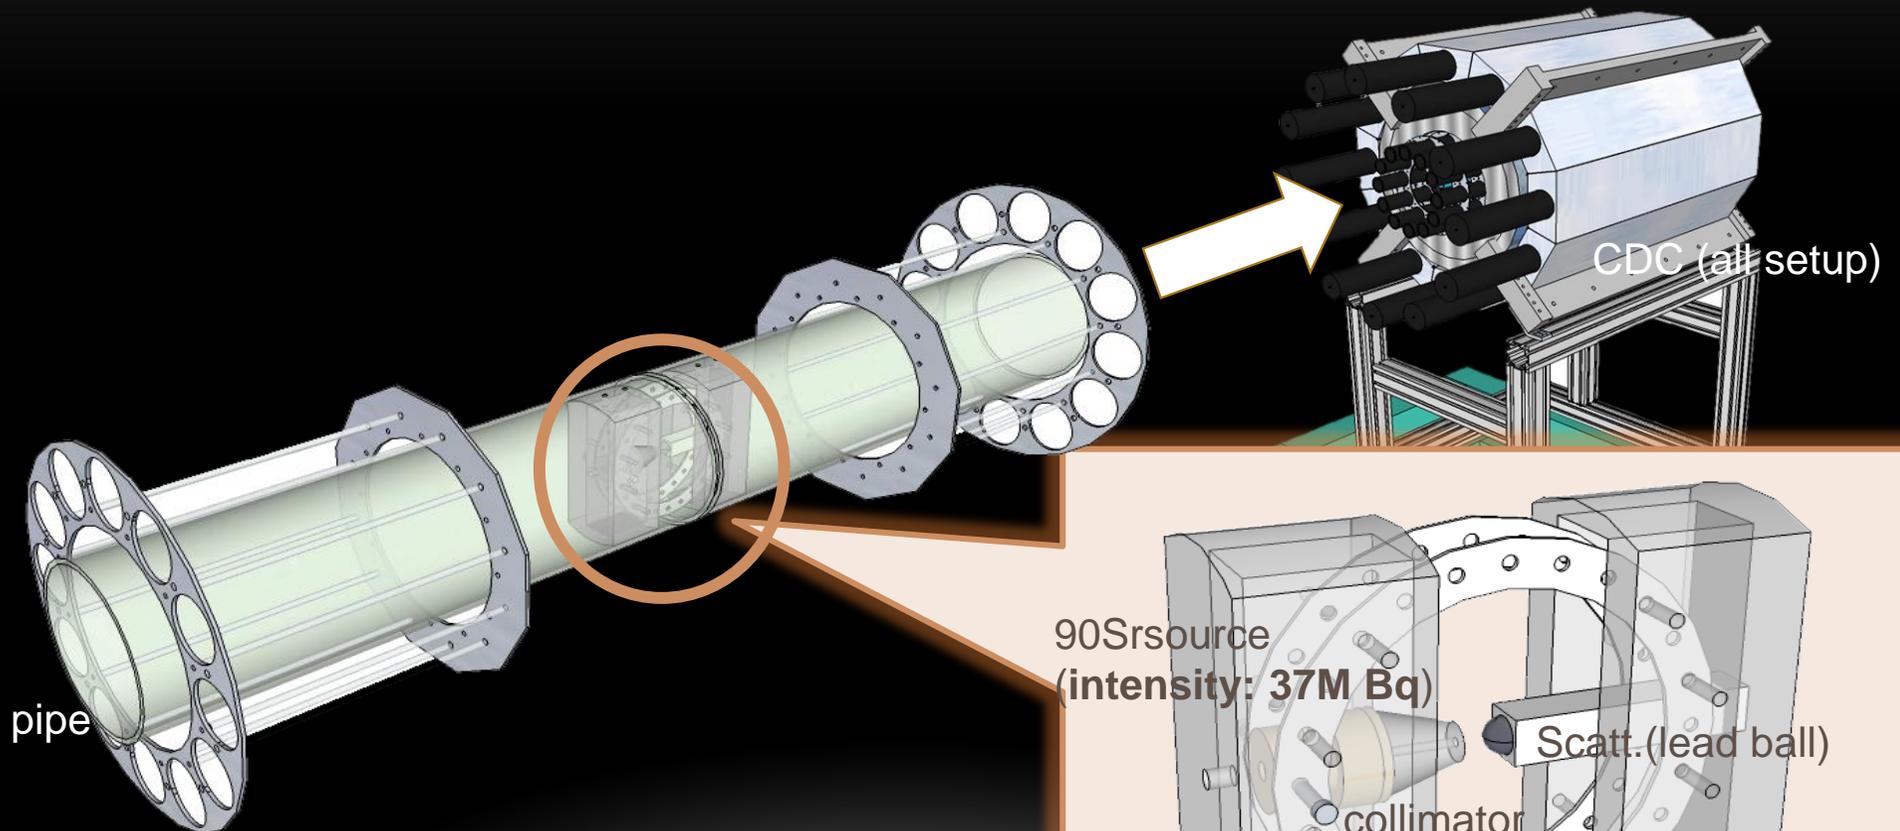

We will search short-range gravitational field around atomic nucleus using MTV detector, and test the tilting from Longitudinal polarization of electron spin by analyzing power of Mott scattering.

By using the electron which have Transverse polarization, it could be checked the principle and the set up of MTV exp.

If a strong gravitational field around Nuclei exist, **an electron spin is getting more changed the direct by Geodetic precession** than without the effect (only Thomas precession and Coulomb scattering).

With change the incidence angle of Sr source to the scattering lead ball, we take the spin change angle by angle.

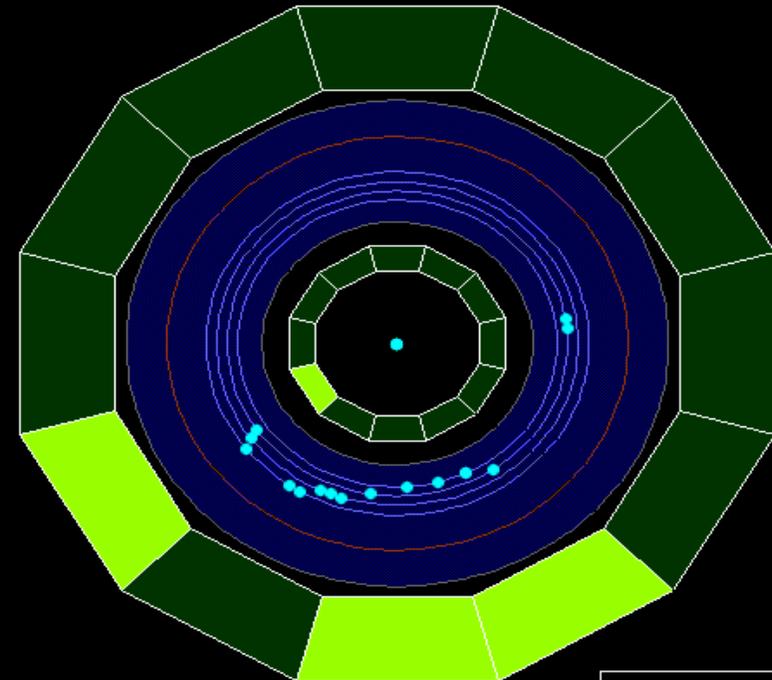

almost of the device material are Plastic to reduce brems.

+++++ Scaler Information(c

Master(Slave)	Master	Slave 1
Trigger Counter 1(E(12))	2,466 (613,529)	170 (
Trigger Counter 2(E(13))	2,406 (599,141)	175 (
Trigger Counter 3(E(14))	5,601 (1,382,100)	179 (
Trigger Counter 4(E(15))	3,036 (768,665)	172 (
Trigger Counter 5(E(16))	5,815 (1,413,660)	197 (

Lv.1 trig. with veto	34,285 (8,438,943)	34,285 (ε
Coincidence window	34,285 (8,438,944)	34,285 (ε
Lv.2 trig. w/o veto	48 (11,201)	0 (
Lv.2 trig. with veto	48 (11,165)	48 (

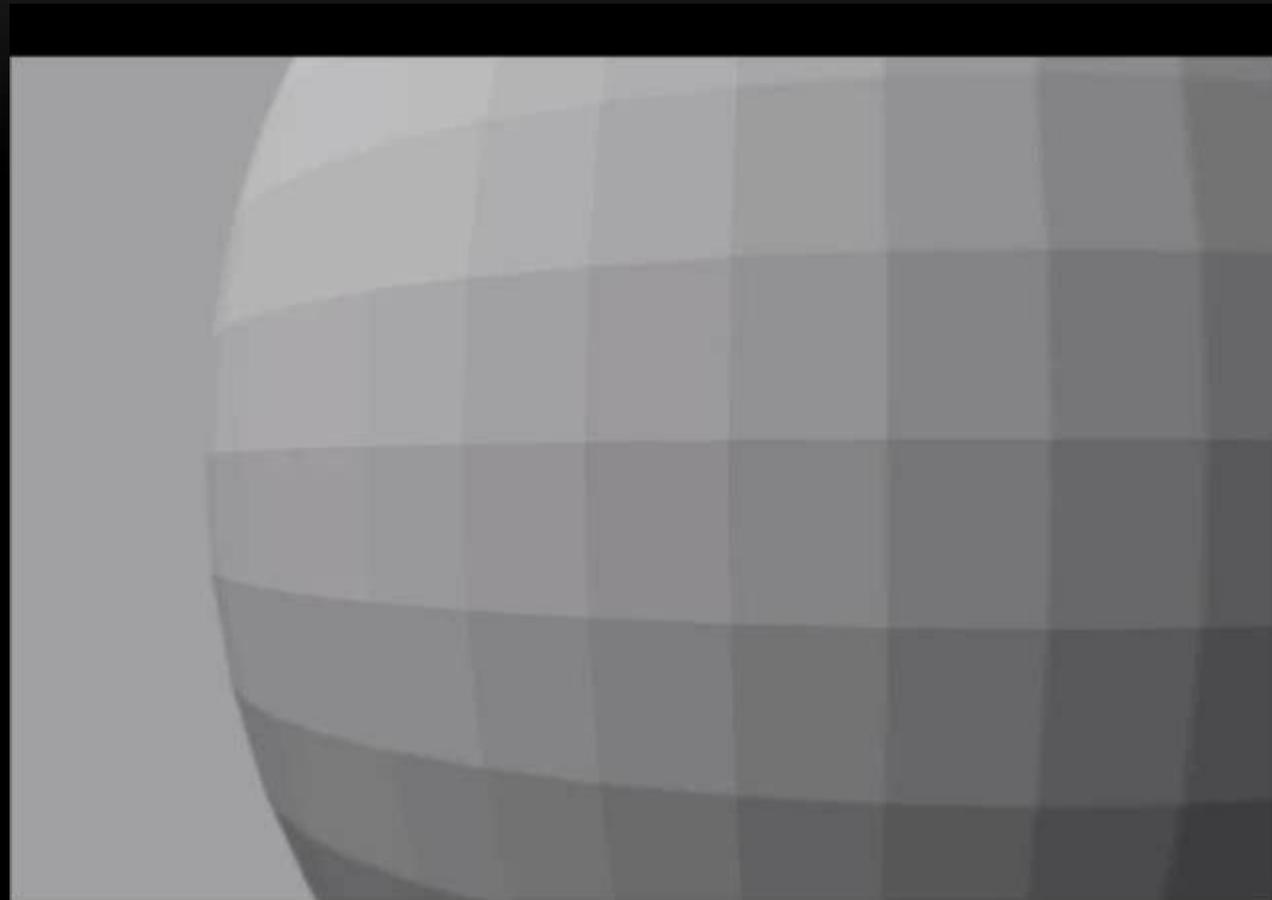

Time: 20
Polarization Control: 1
Lv.1 trig. Acc./Req. =0.9583
Lv.2 trig. Req./Lv.1 Acc. =0.0014
Lv.2 trig. Acc./Req. =0.9949

w/ scatt. Rate : 100~200Hz
w/o scatt. Rate : 40~50Hz

event #1
run #20131142

+++++

Summary

- ✓ The MTV experiment is aiming to search non-zero T-violation in nuclear beta decay by measuring electron transverse polarization.
- ✓ The electron transverse polarization is measured as left-right scattering asymmetry in Mott scattering.
- ✓ Final test experiment for physic run was performed on 11/16 – 11/17
- ✓ We check the rate stability of CDC setup using 10^7 pps
- ✓ We developed new beam stopper and measured relaxation time.

Future Plan

- ✓ Offline tracking analysis
- ✓ Systematic Study
- ✓ First physics run using CDC will performed in 2014.

THAT'S ALL
THANK YOU FOR LISTENING
